

Proposed Policies Water Reuse

Goal	Important	Strike	Consequences	Modifications/Comments
Increase water reuse to better optimize available water supplies.				
Policy				
1. Support efforts by water providers to effectively and environmentally implement potable and non-potable water reuse, including augmentation.				
2. Encourage re-use of treated wastewater for irrigation and other acceptable uses when feasible.				
3. Consider opportunities to demonstrate the benefits of using non-potable sources of water and to dispel negative attitudes.				
4. Encourage land uses which accommodate the reuse of water including capture of non-consumptively used water within the basin and the use of reclaimed water for irrigation, within legal parameters and providing that water quality is maintained.				
5. Support plans for the siting of additional treatment plants or modification of existing facilities to allow for more effective use of non-potable water and to promote plans for responsible aquifer recharge.				
6. Consider allowing higher residential densities for new developments, in appropriate locations, where such developments will be served by water providers that are optimizing their supplies through established reuse and conservation measures.				
7. Explore options for the use of non-potable water and further research into the use of reclaimed and renewable water.
